# FormatConditions.Add method (Excel)

Article • 09/13/2021 • 2 minutes to read • [6 contributors](#) [Feedback](#)

Adds a new conditional format.

## Syntax

*expression*.Add (*Type*, *Operator*, *Formula1*, *Formula2*)

*expression* A variable that represents a [FormatConditions](#) object.

## Parameters

Name	Required/Optional	Data type	Description
<i>Type</i>	Required	<a href="#">XlFormatConditionType</a>	Specifies whether the conditional format is based on a cell value or an expression.
<i>Operator</i>	Optional	Variant	The conditional format operator. Can be one of the following <a href="#">XlFormatConditionOperator</a> constants: <b>xlBetween</b> , <b>xlEqual</b> , <b>xlGreater</b> , <b>xlGreaterEqual</b> , <b>xlLess</b> , <b>xlLessEqual</b> , <b>xlNotBetween</b> , or <b>xlNotEqual</b> . If <i>Type</i> is <b>xlExpression</b> , the <i>Operator</i> argument is ignored.
<i>Formula1</i>	Optional	Variant	The value or expression associated with the conditional format. Can be a constant value, a string value, a cell reference, or a formula.
<i>Formula2</i>	Optional	Variant	The value or expression associated with the second part of the conditional format when <i>Operator</i> is <b>xlBetween</b> or <b>xlNotBetween</b> (otherwise, this argument is ignored). Can be a constant value, a string value, a cell reference, or a formula.

 Feedback

Represents the collection of conditional formats for a single range.

## Remarks

The **FormatConditions** collection can contain multiple conditional formats. Each format is represented by a **FormatCondition** object.

Use the **FormatConditions** property to return a **FormatConditions** object. Use the **Add** method to create a new conditional format, and use the **Modify** method of the **FormatCondition** object to change an existing conditional format.

## Example

The following example adds a conditional format to cells E1:E10.

VB

Copy

```
With Worksheets(1).Range("e1:e10").FormatConditions _  
    .Add(xlCellValue, xlGreater, "=$a$1")  
    With .Borders  
        .LineStyle = xlContinuous  
        .Weight = xlThin  
        .ColorIndex = 6  
    End With  
    With .Font  
        .Bold = True  
        .ColorIndex = 3  
    End With  
End With
```

# FormatCondition object (Excel)

Article • 09/13/2021 • 2 minutes to read • 9 contributors

[Feedback](#)

Represents a conditional format.

## Remarks

The **FormatCondition** object is a member of the **FormatConditions** collection. The **FormatConditions** collection can now contain more than three conditional formats for a given range.

Use the **Add** method of the **FormatConditions** object to create a new conditional format. If a range has multiple formats, you can use the **Modify** method to change one of the formats, or you can use the **Delete** method to delete a format, and then use the **Add** method to create a new format.

Use the **Font**, **Borders**, and **Interior** properties of the **FormatCondition** object to control the appearance of formatted cells. Some properties of these objects aren't supported by the conditional format object model. Some of the properties that can be used with conditional formatting are listed in the following table.

Object	Properties you can use with conditional formatting
Font	<b>Bold</b> , <b>Color</b> , <b>ColorIndex</b> , <b>FontStyle</b> , <b>Italic</b> , <b>Strikethrough</b> , <b>ThemeColor</b> , <b>ThemeFont</b> , <b>TintAndShade</b> , and <b>Underline</b>  The accounting underline styles cannot be used.
Borders	The following borders can be used (all others aren't supported): <b>xlBottom</b> , <b>xlLeft</b> , <b>xlRight</b> , <b>xlTop</b> .  The following border styles can be used (all others aren't supported): <b>xlLineStyleNone</b> , <b>xlContinuous</b> , <b>xlDash</b> , <b>xlDot</b> , <b>xlDashDot</b> , <b>xlDashDotDot</b> , <b>xlGray50</b> , <b>xlGray75</b> , and <b>xlGray25</b> .  The following border weights can be used (all others aren't supported): <b>xlHairline</b> and <b>xlThin</b> .
Interior	<b>Color</b> , <b>ColorIndex</b> , <b>Gradient</b> , <b>Pattern</b> , <b>PatternColor</b> , <b>PatternColorIndex</b> , <b>PatternThemeColor</b> , <b>PatternTintAndShade</b> , <b>ThemeColor</b> , and <b>TintAndShade</b> .

# XIFormatConditionOperator enumeration (Excel)

Article • 01/19/2022 • 2 minutes to read • 6 contributors

 Feedback

Specifies the operator to use to compare a formula against the value in a cell or, for **xlBetween** and **xlNotBetween**, to compare two formulas.

Name	Value	Description
xlBetween	1	Between. Can be used only if two formulas are provided.
xlEqual	3	Equal.
xlGreater	5	Greater than.
xlGreaterEqual	7	Greater than or equal to.
xlLess	6	Less than.
xlLessEqual	8	Less than or equal to.
xlNotBetween	2	Not between. Can be used only if two formulas are provided.
xlNotEqual	4	Not equal.
